Abstract

The Rio Manso, a tributary to Rio Cuiabá, Rio Paraguai basin, is situated upstream from the Brazilian Pantanal and its ichthyofauna has many species in common with the typical fishes from the Pantanal and with those from the Rio Paraguai proper. The Manso Reservoir region of influence was sampled up to the Pantanal, including different environments, such as rivers, streams, lagoons, and the Reservoir itself, in the Rio Manso. Fish species were collected from March 2000 to February 2005, using different fishing gear, such as gill nets, seines, casting nets, and electro fishing. Considering the entire period, 250 fish species were collected, and are distributed in three Classes, 11 Orders, and 37 Families, from which 33 species do not yet correspond to any formal description, indicating that they should be new.

Introduction

The Rio Manso, a tributary to Rio Cuiabá, Rio Paraguai basin, is situated upstream from the Brazilian Pantanal and its ichthyofauna has many species in common with the typical fishes from the Pantanal and with those from the Rio Paraguai proper. Regarding the Pantanal ichthyofauna, the most current work was published by Britski et al. (1999), which present keys to species identification, comparative descriptions of the species, in addition to colorful illustrations and

remarks about nomenclatural problems of some groups less studied from a taxonomic point of view.

Material and Methods

The Manso Reservoir region of influence was sampled, including the region downstream, which reaches the Pantanal (Figure 1). Sample environments include rivers (Manso and Casca – upstream from the reservoir, Quilombo and Palmeira – affluents of the reservoir, and Manso, Cuiabazinho, and Cuiabá – downstream from the reservoir), streams (São Joaquim and Lajinha – affluents of the reservoir, Forquilha – affluent of the Rio Manso, downstream from the reservoir, Cancela, Custódio, and Imbaúba – affluents of Rio Cuiabá, downstream from the reservoir), lagoons (Chacororé and Sinhá Mariana – connected to Rio Cuiabá, in the Pantanal region, downstream from the reservoir), and the Reservoir itself, in the Rio Manso.

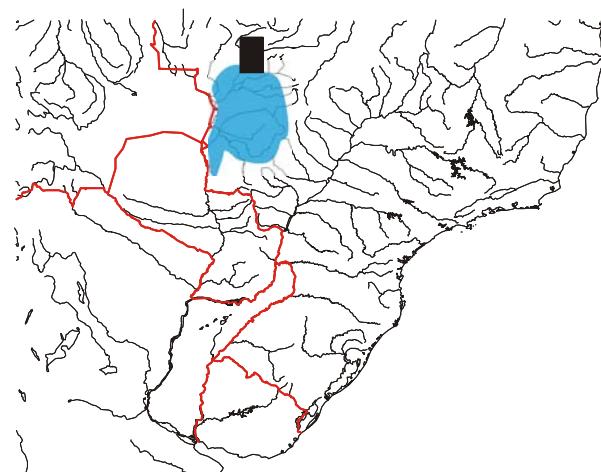

Figure 1. Partial map of Brazil and adjoining countries showing sampled region (black rectangle) – 14°45'18"S/55°31'41"W to 16°20'16"S/56°00'34"W - and Pantanal (blue object).

Fish species were collected from March 2000 to February 2005, using different fishing gear, such as gill nets, seines, casting nets, and electro fishing. They were collected according to IBAMA (Instituto Brasileiro do Meio Ambiente e dos Recursos Naturais Renováveis) authorization numbers 74/99 and 48/02. To identify the species, Britski et al. (1999) was decisive, as well as contacts with experts on some fish groups.

LISTS OF SPECIES

Voucher specimens of each species are deposited in the fish collection of Nupélia (Núcleo de Pesquisas em Limnologia, Ictiologia e Aqüicultura) of the Universidade Estadual de Maringá.

The classification presented is based on Reis et al. (2003), which gives a classification based on current phylogenetic works, and nomenclatural changes, like new synonymic lists and new combinations of names. These were obeyed in the present study whenever other works corroborating the proposed alterations had been formally published. Some taxonomic changes published after Reis et al. (2003) were also considered herein.

Results and discussion

Superior categories follow Eschmeyer (1990) and families are presented according to Reis et al. (2003). The species first recorded in the region are

marked with an asterisk and those that had some nomenclatural alteration based on Reis et al. (2003) have two asterisks. The local common names of the species are provided in simple quotes.

Considering the entire period, 250 fish species were collected, and are distributed in three Classes, 11 Orders, 37 Families, and 155 Genera (Table 1). Compared to the inventory presented by Britski et al. (1999) for the entire Pantanal, from the 263 species they reported, 206 (78.3 %) were captured at the region studied here, but 37 (18.0 %) had their names changed (considering current publications). In addition, 44 (21.4 %) species were recorded by the present study for the first time in the sampled region and, from them, 32 (72.7 %) do not yet correspond to any formal species description, indicating that they should be new.

Table 1. Fish species collected in the Rio Manso Reservoir region of influence, from March 2000 to February 2005. Superior categories follow Eschmeyer (1990) and families follow Reis et al. (2003). * species first recorded in the region; ** species that had some nomenclatural alteration based on Reis et al. (2003). Simple quotes present local common names of the species.
