ABSTRACT: We reviewed the geographical distribution of *Pseudoeryx plicatilis* in South America, and present new records in Bolivia and from nine Brazilian states. This is the first record of *P. plicatilis* in the states of Acre, Amapá, and Roraima, northern region of Brazil. The presence of *P. plicatilis* in the municipality of Alta Floresta expands its distribution about 650–700 km northward in the state of Mato Grosso, and about 620 km southward from the nearest localities in the state of Pará. Other new records are presented, which contribute to the knowledge of the distribution of *P. plicatilis* in South America.

Pseudoeryx (Fitzinger, 1826) is a large aquatic dipsadid snake (attain 1,270 mm in snout-vent length) belonging to the subfamily Xenodontinae, tribe Hydropsini. The tribe includes two other genera: *Hydrops* (Wagler, 1830) and *Helicops* (Wagler, 1830) (Zaher 1999). The genus currently contains two species: *Pseudoeryx plicatilis* (Linnaeus, 1758) and *P. relicta*, being the last one a recently described species endemic to the Maracaibo Lake basin, Venezuela (Schargel *et al.* 2007). *Pseudoeryx plicatilis* has previously been reported to occur in many countries of South America from Guyana region to Argentina (*e.g.* Hoge and Nina 1964; Williams and Fugler 1968; Cunha and Nascimento 1978; 1993; Gasc and Rodrigues 1980; Hoogmoed 1982; Pérez-Santos and Moreno 1988; Strüssmann and Sazima 1993; Carrillo de Espinoza and Icochea 1995; Silva Jr and Sites Jr 1995; Carvalho and Nogueira 1998; Giraudo 1999; Kornacker 1999; Frota *et al.* 2005; Marques *et al.* 2005; Schargel *et al.* 2007). However, most of these records do not define accurate localities, referring to the distribution of *P. plicatilis* in regional or national lists of species (*e.g.* Gasc and Rodrigues 1980; Hoogmoed 1982; Pérez-Santos and Moreno 1988; Kornacker 1999). Additionally, voucher specimens are provided only in Hoge and Nina (1964), Williams and Fugler (1968), Cunha and Nascimento (1993), Giraudo (1999), Frota *et al.* (2005), Marques *et al.* (2005), and Schargel *et al.* (2007).

Although this species is not registered on regional or national lists of threatened species in Brazil, information concerning geographic distribution, as well as natural history and taxonomy, are fundamental for determining the levels of threat of snakes and for establishing conservation strategies for such species (França and Araújo 2006; Martins and Molina 2008). Here we reviewed the geographical distribution of *P. plicatilis* in South America (based on Brazilian collections). New records in Bolivia and from nine Brazilian states are presented.

The geographic distribution of *P. plicatilis* was described by checking preserved specimens (see appendix) from

the collections of Instituto Butantan (IBSP; São Paulo), Instituto Nacional de Pesquisas da Amazônia (INPA; Manaus), Museu de Ciências e Tecnologia da PUC-RS (MCP; Porto Alegre), Museu de História Natural Capão da Imbuia (MHNCI; Curitiba), Museu Paraense Emílio Goeldi (MPEG; Belém), Museu de Zoologia da Universidade de São Paulo (MZUSP; São Paulo), Coleção Herpetológica da Universidade Federal de Mato Grosso (UFMT; Cuiabá), and Coleção Zoológica de Referência do Campus de Corumbá da Universidade Federal do Mato Grosso do Sul (CEUCH; Corumbá). Literature records with precise localities are also included in the map (Figure 1).

This is the first record of *P. plicatilis* in the states of Acre, Amapá, and Roraima, in the northern region of Brazil (Figure 1). The presence of this species in the municipalities of Mâncio Lima and Porto Walter (Acre), near to the upper stretch of the Juruá River, expands its previous distribution about 450 km southward (see Carrillo de Espinoza and Icochea 1995; Silva Jr and Sites Jr 1995). The occurrence of this species in the Macapá and Mazagão municipalities (Amapá), near to the lower stretch of the Amazonas River and Marajó Island, expands its previous distribution about 340 km westward from the nearest localities in the state of Pará (see Cunha and Nascimento 1978; 1993). The presence of *P. plicatilis* in Boa Vista (Roraima), near to the upper stretch of the Branco River, expands its previous distribution about 550 km northward (see Silva Jr and Sites Jr 1995).

We present voucher specimens for *P. plicatilis* in the state of Rondônia (municipalities of Costa Marques and Espigão d'Oeste). Hoge and Nina (1964) once reported the presence of this species to Rondônia, for the locality "Mutun-Paraná, Rio Nadim", however the authors do not provide voucher number.

We also confirmed the occurrence of *P. plicatilis* in the state of Maranhão, northeastern region of Brazil. Cunha and Nascimento (1993) indicated that this species occurs in Maranhão, but they did not provide specific locality

or voucher number. The presence of *P. plicatilis* in the municipalities of Arari and Mirinzal, the easternmost points in the state (about 250 km west of the Parnaíba River, on the border between the states of Maranhão and Ceará), expands its previous distribution about 330 km eastward (see Cunha and Nascimento 1978; 1993).

The presence of *P. plicatilis* in the municipality of Alta Floresta, near to the upper stretch of the Teles Pires River, expands its distribution about 650 to 700 km northward

in the state of Mato Grosso (see Strüssmann and Sazima 1993; Carvalho and Nogueira 1998; Marques et al. 2005), and about 620 km southward from the nearest localities in the state of Pará (see Hoge and Nina 1964).

Pseudoeryx plicatilis has been mentioned to occur in Bolivia (Kornacker 1999), but the author did not provide specific locality or voucher number. Here we present a voucher specimen to eastern Bolivia (municipality of San Ignacio de Velasco). This record expands its distribution

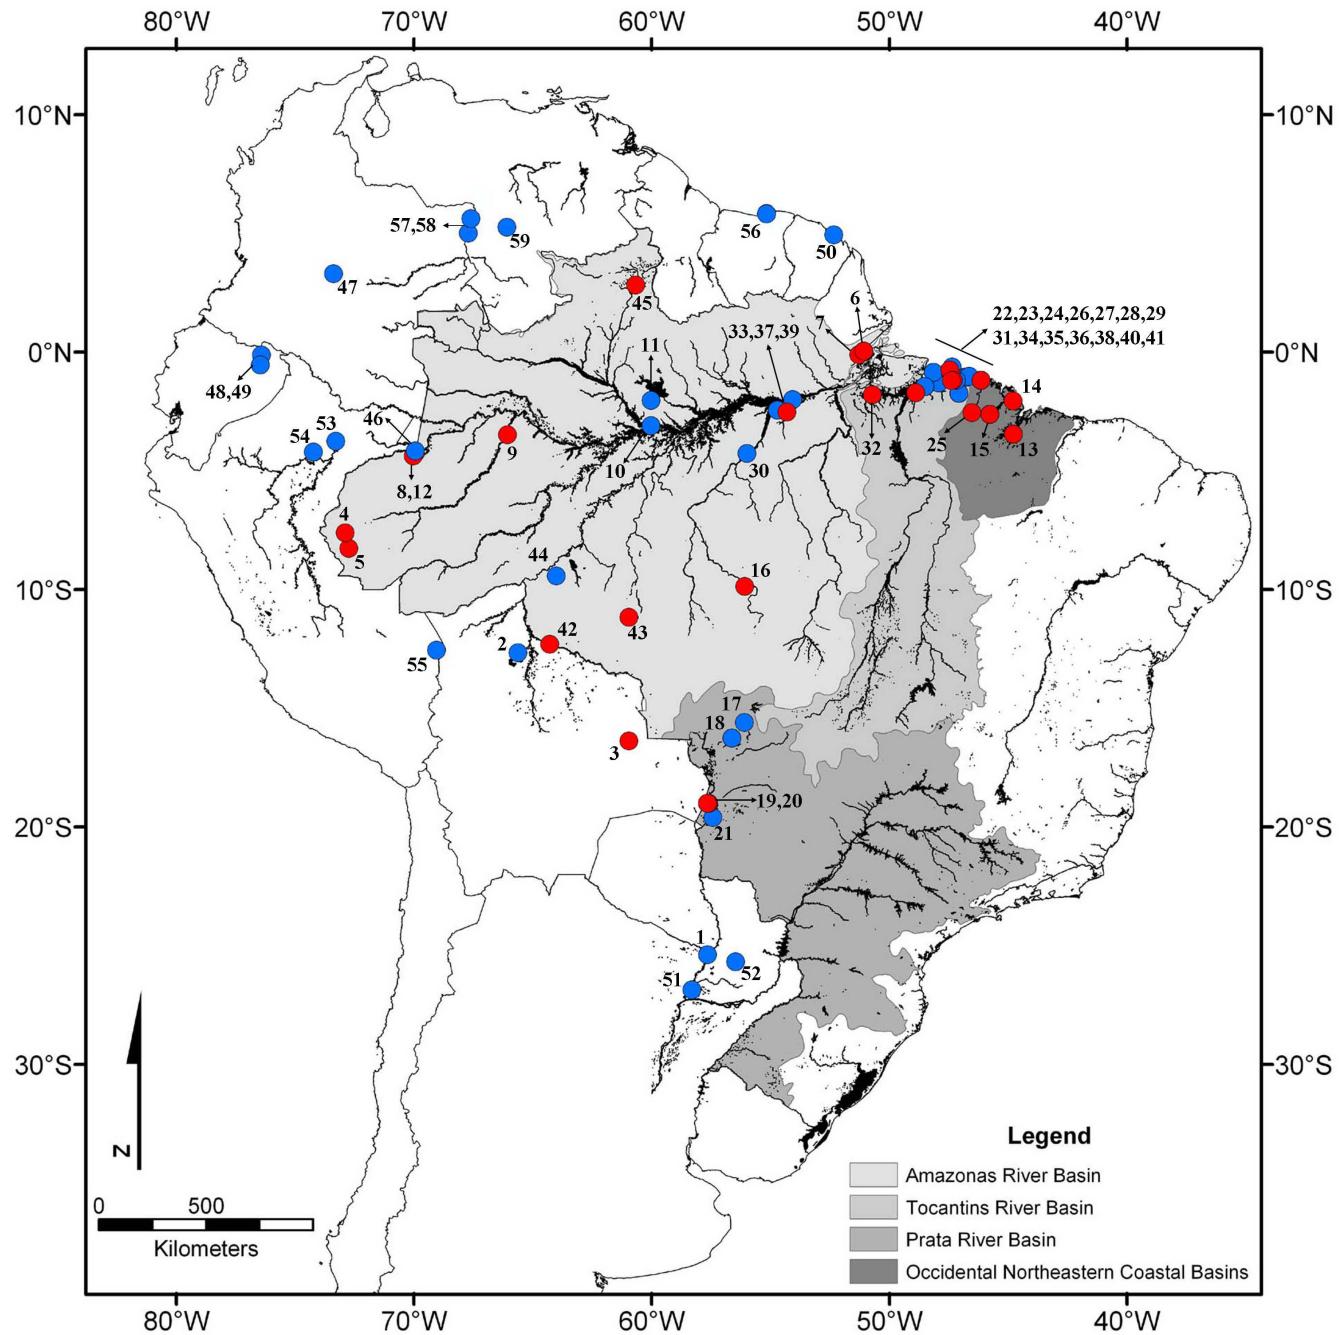

FIGURE 1. Geographical distribution of *Pseudoeryx plicatilis* in South America along the major river basins. Red dots = new localities with records of *P. plicatilis*. Blue dots = previous records from literature (Hoge and Nina 1964; Williams and Fugler 1968; Cunha and Nascimento 1978; 1993; Strüssmann and Sazima 1993; Carrillo de Espinoza and Icochea 1995; Silva Jr and Sites Jr 1995; Carvalho and Nogueira 1998; Giraudo 1999; Frota et al. 2005; Marques et al. 2005; Schargel et al. 2007). **Argentina.** Formosa: Pilcomayo¹; **Bolívia.** El Beni: Mamoré River²; Santa Cruz: San Ignacio de Velasco³; **Brazil.** Acre: Mâncio Lima⁴, Porto Walter⁵; Amapá: Macapá⁶, Mazagão⁷; Amazonas: Benjamin Constant⁸, Juruá⁹, Manaus¹⁰, Balbina, Presidente Figueiredo¹¹, Tabatinga¹²; Maranhão: Arari¹³, Mirinzal¹⁴, Paruá, Santa Luzia do Paruá¹⁵; Mato Grosso: Alta Floresta¹⁶, Cuiabá¹⁷, Poconé¹⁸; Mato Grosso do Sul: Corumbá¹⁹, Ladário²⁰, Porto Esperança, Corumbá²¹; Pará: Augusto Corrêa²², Belém²³, Bragança²⁴, Gurupi River, Canindé²⁵, Capanema²⁶, Capitão Poço²⁷, Castanhal²⁸, Igarapé-Açu²⁹, Itaituba³⁰, Maracanã³¹, Melgaço³², Monte Alegre³³, Nova Timboteua³⁴, Peixe-Boi³⁵, Salinópolis³⁶, Santarém³⁷, Santarém Novo³⁸, Taperinha, Santarém³⁹, Vigia⁴⁰, Viseu⁴¹; Rondônia: Costa Marques⁴², Espigão d'Oeste⁴³, Mutum-Paraná, Nadiim River⁴⁴; Roraima: Boa Vista⁴⁵; **Colombia.** Amazonas: Leticia⁴⁶; Meta: Lomalinda⁴⁷; **Ecuador.** Napo: Limon Cocha⁴⁸; Sucumbios: Tarapoa⁴⁹; **French Guiana:** Caïena⁵⁰; **Paraguay.** Ñeembucú: Pilar⁵¹, Yataaty⁵²; **Peru.** Loreto: Iquitos⁵³, Loreto⁵⁴; Madre de Dios: Puerto Maldonado⁵⁵; **Suriname:** Paramaribo⁵⁶; **Venezuela.** Amazonas: Pendare⁵⁷, Puerto Ayacucho⁵⁸, San Juan de Manapiare⁵⁹.

about 650 km eastward in Bolivia (Mamoré River; Cope 1885, *apud* Hoge and Nina 1964), and about 500 km westward from the nearest localities in Brazil (see Hoge and Nina 1964).

In summary, *P. plicatilis* is widely distributed in Tropical South America, along the major river basins (see Figure 1). This species occurs to the east of the Andean, in the northern region of the Amazonian rainforest (*e.g.* Orinoco River basin and Guyana region), along the Amazonas River basin and its major tributaries (*e.g.* Juruá, Madeira, and Tapajós) to the east of the state of Pará and west of the state of Maranhão (in the occidental northeastern coastal basins). *Pseudoeryx plicatilis* also occurs along the Prata River basin (restrict to the Paraguay River basin), in the states of Mato Grosso and Mato Grosso do Sul in Brazil (in flooded areas of the Pantanal region), to the east of Bolivia, north of Argentina, and southwestern Paraguay (Humid Chaco region) (Hoge and Nina 1964; Williams and Fugler 1968; Cunha and Nascimento 1978; 1993; Hoogmoed 1982; Strüssmann and Sazima 1993; Carrillo de Espinoza and Icochea 1995; Silva Jr and Sites Jr 1995; Carvalho and Nogueira 1998; Giraudo 1999; Frota et al. 2005; Marques et al. 2005; Schargel et al. 2007; present study).

Additionally, *P. plicatilis* may be sympatric with *Hydrops martii*, *H. triangularis*, and *Helicops* spp. along the Amazonas River basin, east of Pará and west of Maranhão (see Cunha and Nascimento 1978; 1993; Frota et al. 2005), and with *Hydrops caesurus* and *Helicops leopardinus* (and possibly *H. polylepis* and *H. angulatus*; RRS unpublished data) along the Paraguay River basin and Pantanal region (Scrocchi et al. 2005; Ávila et al. 2006). Nothing is known about the microhabitat used by *P. plicatilis*, but this species may occur in permanent and temporary aquatic habitats, both in forested and open areas (see Cunha and Nascimento 1978; 1993; Ávila et al. 2006).

Nowadays, two subspecies of *Pseudoeryx plicatilis* are recognized: *P. p. plicatilis* and *P. p. mimeticus* (see Hoge and Nina 1964). These subspecies are inter-graded in some regions in Brazil and the differentiation of the two forms is not clear in many taxonomic and geographic aspects (Hoge and Nina 1964; Cunha and Nascimento 1978; 1993). Thus, future works covering taxonomic and molecular attributes of different populations of *P. plicatilis* along its distribution certainly will provide subsidies for more specific studies (*e.g.* biogeography).

ACKNOWLEDGMENTS: We thank Francisco L. Franco (IBSP), Richard Vogt (INPA), Ana L. Prudente (MPEG), Hussam Zaher (MZUSP), Marcos A. de Carvalho (UFMT), and Vanda L. Ferreira (CEUCH) for allowed access to the specimens under their care; Frederico França, Otavio A. V. Marques, and Renato S. Bérnails for the comments that improved the manuscript; Renato S. Bérnails for identification of the specimens vouchered in the collections of MCP and MHNCI; Fausto E. Barbo and Fernando M. Couto for assistance in the map preparation; Verônica A. Barros for the English revision; Fundação de Amparo à Pesquisa do Estado de São Paulo (FAPESP) provided fellowship (06/50279-8) for Rodrigo R. Scartozzoni and Fundação do Desenvolvimento Administrativo (FUNDAP) provided fellowship to Vivian C. Trevine.
