ABSTRACT: We report the first record of *Physalaemus albifrons* in the state of Alagoas, in the municipality of Boca da Mata, Brazil.

The genus *Physalaemus* Fitzinger, 1826 is currently composed of 45 species (Frost 2011), with ample geographic distribution in South America, encompassing all the Brazilian regions, Misiones and Entre Ríos in Argentina, eastern Paraguay, Santa Cruz in Bolivia and likely the plains of southern Venezuela (Costa and Jim 2009). *Physalaemus* species are divided into seven groups: the *P. albifrons* species group including four species, the *P. cuvieri* species group including nine species, the *P. deimaticus* species group including three species, the *P. gracilis* species group including five species, the *P. henselii* species group including three species, the *P. signifer* species group including 13 species (Nascimento *et al.* 2005) and the *P. olfersii* species group including eight species (Cassini *et al.* 2010).

Physalaemus albifrons (Spix, 1824, Figure 1) is a species native to Brazil, found in open areas, from the state of Maranhão to the southern part of the state of Minas Gerais (Andrade and Flora 2004). The species is usually found near water, in waterlogged soil with their body partially submerged or on aquatic macrophytes and is strictly nocturnal, initiating vocalization at dusk (Arzabe *et al.* 2005; Vieira *et al.* 2007).

On 23 May 2011 we collected a male specimen of *P. albifrons* in the municipality of Boca da Mata in the state of Alagoas, Brazil ($09^{\circ}41'19''$ S, $36^{\circ}12'07''$ W; elevation 170 m), in the Cariri da Prensa farm. The individual was found in a temporary pond in a sugar cane plantation. The preserved specimen is registered as MUFLA 8793 in the Museum of Natural History, Universidade Federal de Alagoas – UFAL under collecting license 28997-1 (ICMBIO - Instituto Chico Mendes de Conservação da Biodiversidade).

Although previous reports show a wide occurrence of *P. albifrons* in northeastern Brazil (Table 1; Figure 2), the species had never been recorded from the state of Alagoas. The previous closest records to the new locality are Betânia, Pernambuco (255 km airline to the west, see

FIGURE 1. *Physalaemus albifrons* (MUFLA 8793), collected in the Cariri da Prensa farm, municipality of Boca da Mata, state of Alagoas, Brazil. Photo by Ubiratan Gonçalves.

FIGURE 2. Distribution map of *Physalaemus albifrons*. The new locality is indicated by a red dot.

Borges-Nojosa and Santos 2005) and Aracaju, Sergipe (190 km airline to the south, see Oliveira and Junior 2000). Loebmann and Mai (2008) found the species while

inventorying the anurofauna of three coastal municipalities in the state of Piauí (Parnaíba, Luís Correia and Cajueiro da Praia).

TABLE 1. Localities and references used for the *Physalaemus albifrons* distribution.
