---

### Abstract

The information about the distribution of 5 species of jelly fungi of Dacrymycetes, recorded in different locations of the Cerrado biome, is updated or expanded. *Dacrymyces chrysospermus* Berk. & M.A. Curtis, *Dacryopinax elegans* (Berk. & M.A. Curtis) G.W. Martin, *D. maxidorii* Lowy and *D. spathularia* (Schwein.) G.W. Martin are the first records for the Cerrado and the Brazilian Midwest Region. *Calocera cornea* (Batsch) Fr. is being reported for the first time in Goiás state and newly reported for the Federal District, after 40 years.

---

### Key words

Dacrymycetaceae; Dacrymycetales; geographic distribution; jelly fungi.

## Introduction

Dacrymycetes is a monophyletic clade belonging to the phylum Basidiomycota, with evolutionary origin estimated at 280–360 MYA (Dentinger et al. 2009). Dacrymycetes is a sister group of the Agaricomycetes in the Agaricomycotina clade (Hibbett 2006, Hibbett et al. 2007) and has 1 order and 1 family (Dacrymycetales: Dacrymycetaceae), 13 genera and 156 species (Oberwinkler 2014, Kirk 2015).

Dacrymycetes is macroscopically characterized by gelatinous or cartilaginous basidioma, ranging from strictly corticoid to pustulate, cupulate, cyphelloid, stalked-capitate or clavarioid, with color varying from yellow to orange and brown. Microscopically, it is characterized by frequent, modified, thick-walled hyphae on the abhymenial surface, denominated marginal

hairs, forked (bifurcate) basidia (except in *Dacrymyces unisporus* (L.S. Olive) K. Wells), basidiospores with transverse septation in mature stages, and germination with microconidia or hyphae, but without secondary spores (McNabb 1964, 1965a, 1965b, 1965c, 1965d, 1965e, 1966, Oberwinkler 2014, Shirouzu et al. 2009). Species that belong to this class are brown-rot fungi and potent cellulose degraders, with their enzymatic activity comparable to large hydrolase producers found in species of the old order Aphylophorales (Worrall et al. 1997).

In Brazil, 15 species are reported, but the knowledge about the group is limited to few studies. Teixeira (1945) and Viégas (1945) reported *Dacryopinax spathularia* (Schwein.) G. W. Martin.; Lowy (1971) reported 8 species (*Arrhytidia involute* (Schwein.) Coker, *Calocera cornea* (Batsch) Fr., *Cerinomyces lagerheimii* (Pat.) McNabb, *Dacrymyces deliquesens* var. *ellisii* (Coker) L. L. Kenn),

**Figure 1.** Distribution of the sites sampled in Goiás state and Federal District. Map of South America, showing collection areas in Brazil (left), and Collection sites in Goiás state and Federal District. Maps produced with R Software.

*Dacryopinax elegans* (Berk. & M. A. Curtis) G. W. Martin, *D.indacocheae* Lowy, *D. spathularia* (Schwein.) G. W. Martin, *Ditiola radicata* (Alb. & Schwein.) Fr., and later (Lowy 1981) described *D.maxidorii* Lowy; Sotão et al. (2002) reported *Calocera cornea*, *D. maxidorii* Lowy; Campos (2005) *D. maxidorii* Lowy; Sobestiansky (2005) *Dacrymyces enatus* var. *macrosporus* L. L. Kenn., *D elegans* (Berk. & M. A. Curtis) G. W. Martin, *D. spathularia* (Schwein.) G. W. Martin; Meijer (2006) reported 8 species (*Cerinomyces lagerheimii* (Pat.) McNabb, *Dacrymyces chrysospermus* Berk. & M.A. Curtis, *D. stillatus* Nees, *Dacryopinax elegans* (Berk. & M. A. Curtis) G. W. Martin, *D. martinii* Lowy, *Dacryopinax spathularia* (Schwein.) G. W. Martin, *Guepiniopsis buccina* (Pers.) L. L. Kenn.; Trieveiler-Pereira et al. (2009), *Calocera cornea* (Batsch) Fr.; and, most recently, Shirouzu et al. (2013) described *Calocera arborea* Shirouzu.

The present study expands the knowledge of the geographical distribution of Dacrymycetes species in Brazil.

## Methods

Specimens were collected during 2008–2014 in different locations in Cerrado areas of Goiás state: Anápolis, campus of the Universidade Estadual de Goiás, Reserva Ecológica da Trilha do Tatu; Parque Ambiental Antônio Marmo Canedo, both in mesophyll forest; Mata de Galeria do Ribeirão das Antas, AmBev, Cebrasa Branch, in gallery forest; Terezópolis de Goiás, Reserva Particular do Patrimônio Natural (RPPN), Fazenda Santa Branca; Goiânia, Campus II of the Universidade Federal de Goiás, Bosque Auguste Saint-Hilaire (BASH), both in mesophyll forest; Caldas Novas, Parque Estadual da Serra de Caldas Novas (PESCAN), and Rio Quente, in mesophyll and semi-deciduous forest. Specimens were also collected at 1 area in the Federal District: Brasília, Jardim Botânico de Brasília, mesophyll forest (Fig. 1).

The basidiomata underwent dry and wet preservation and were deposited at the Herbarium of Universidade Estadual de Goiás (HUEG). Macro- and microscopic taxonomic features were studied, including the general

aspect of the basidioma, hymenial surface, basidia, and basidiopores according to McNabb (1964, 1965a, 1965b, 1965c, 1965d, 1965e, 1973), Lowy (1971, 1981), and Shirouzu et al. (2009).

## Results

***Calocera cornea* (Batsch) Fr., Stirpes Agri Femisionensis 5: 67. 1827.**

= *Clavaria cornea* Batsch, Elenchus fungorum: 139. 1783.

**Figures 2–6**

Basidiomata scattered, cylindrical, subulate, simple, slightly branched, dendroid, white to yellow, soft-cartilaginous, (1)5–15 × (0.5)1–2 mm. Structure showing in transverse section a central core of compact parallel hyphae surrounded by a zone of loosely interwoven hyphae enclosed by the hymenium. Internal hyphae branched, thin- or thick-walled, septate, sub-hyaline, 2–4.5 µm in diameter, without clamp connections. Hymenium amphigenous. Probasidia cylindrical to clavate, pale yellow, 20–28 (35) × 2–4 µm, becoming bifurcate. Metabasidia cylindrical to clavate, becoming bifurcate 16–26 × 2–3 µm, basidiospores subglobose to reniform, with an apiculum at the base, thin-walled, sub-hyaline, 7–10 × 2–3 µm, 0–1 septate.

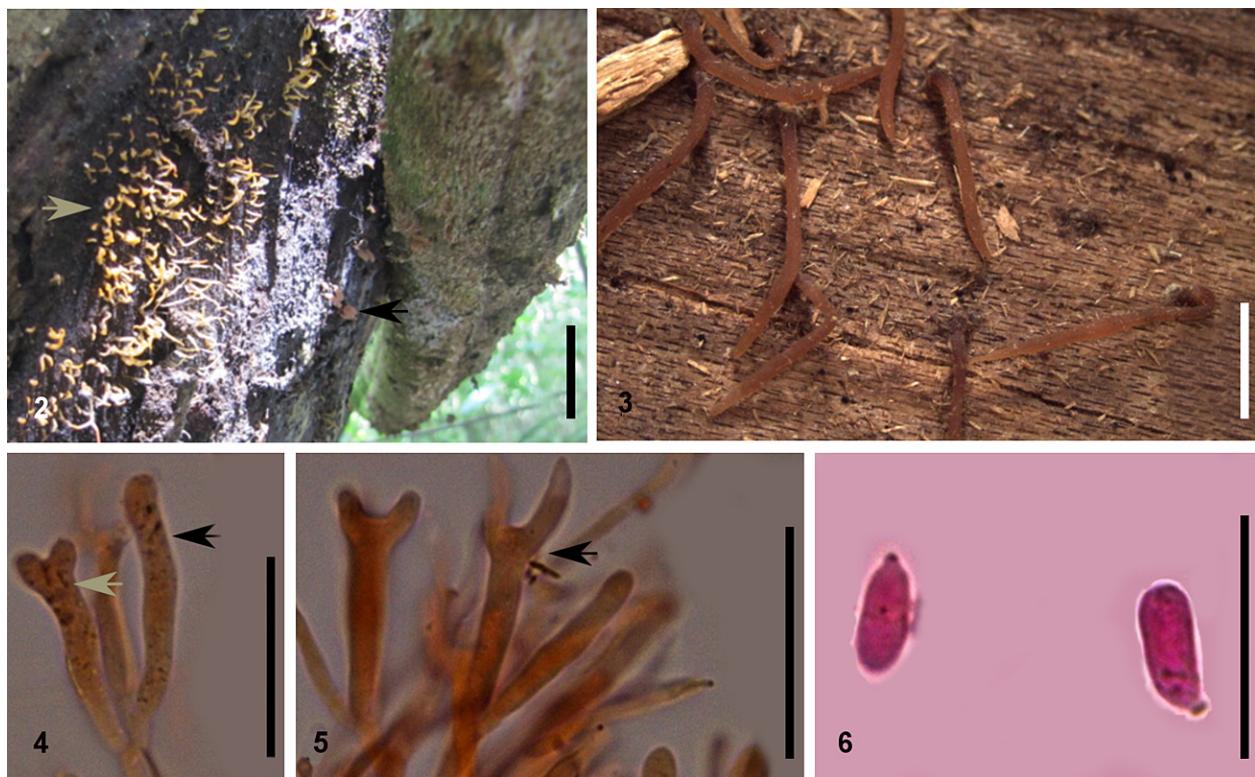

**Material examined.** BRAZIL, Federal District: Jardim Botânico de Brasília, 01.XII.2010. Alvarenga, R.L.M. (32), HUEG 10503; Goiás: Rio Quente (17°47'35" S, 048°47'36" W), 01.V.2008, Xavier-Santos, S. (2501), HUEG 8438; Caldas Novas (17°42'53" S, 048°43'46" W), 23.I.2008, Xavier-Santos, S. (2293), HUEG 8402; City of Anápolis, Reserva Ecológica do Campus da Universidade Estadual de Goiás (16°19'37" S, 048°57'10" W) 10.XII.2010, Xavier-Santos, S. (4501), HUEG 8459; 04.X.2010, Alvarenga, RLM. (42), HUEG 8482; Alvarenga, RLM. (105), HUEG 10504; Mata Ciliar do Ribeirão das Antas, AmBev (Filial Cebrasa) (16°17'38" S, 048°48'54" W), 29.III.2011, Xavier-Santos, S. (4784), HUEG 10506 (associated to myxomycetes *Arcyria denudata* (L.) Wettst.).

**Notes on distribution.** Cosmopolitan. In Brazil, this species is recorded in the states of Amazonas, Pará, São Paulo, Paraná, Santa Catarina, and Rio Grande do Sul, including the, in Amazon, Atlantic Forest and Cerrado biomes (Lowy 1971, Campos et al. 2005, Sobestiansky 2005, Trieveiler-Pereira et al. 2009). The new records extend the geographic distribution of *C. cornea* to Goiás state and include the second record from the Cerrado biome and the only record from the Federal District in more than 40 years.

***Dacrymyces chrysospermus* Berk. & M.A. Curtis,** Grevillea 2 (14): 20. 1873.

**Figures 7–8**

Basidiomata scattered or gregarious, flabellate or stoutly stipitate with a spathulate, yellow, firm-gelatinous, 4 cm

**Figure 2–6.** *Calocera cornea*. **2.** Basidiomata of *Calocera cornea* when fresh (gray arrow) associated to sporangium of myxomycete *Arcyria denudata* (black arrow); HUEG 10506, scale bar = 1 cm. **3.** Basidioma when dried (HUEG 8438), scale bar = 2 mm. **4.** Probasidia (black arrow) and metabasidia (gray arrow), scale bar = 20  $\mu$ m. **5.** Immature metabasidia (black arrow), scale bar = 20  $\mu$ m. **6.** Basidiospores, scale bar = 20  $\mu$ m.

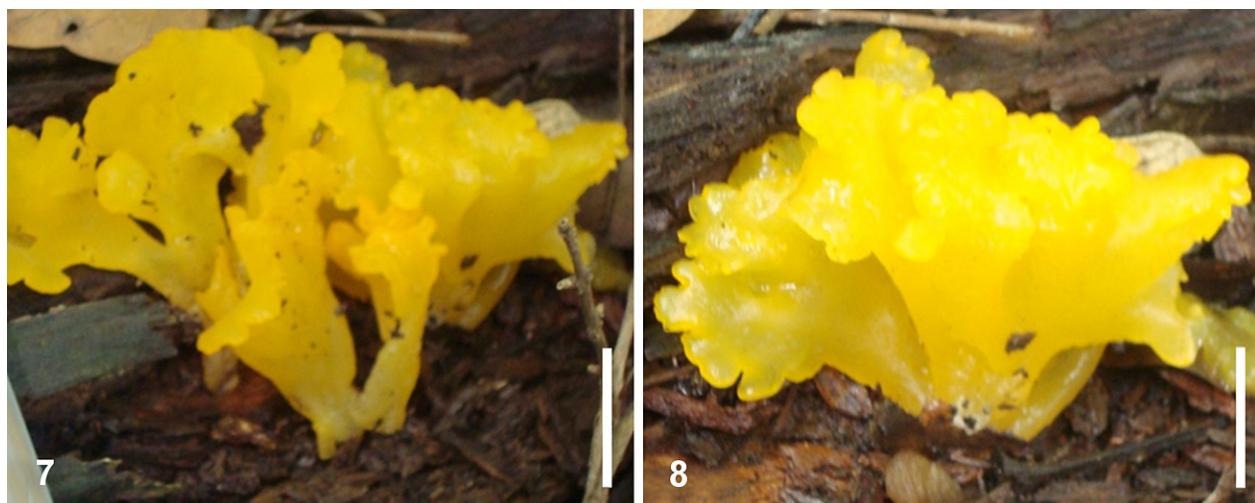

high, 6–13 mm in height. Internal hyphae branched, thin-walled, gelatinous, septate, pale yellow, 2–3  $\mu$ m diameter, without clamp connections. Hymenium limited to upper surface of the pileus. Probasidia cylindrical to clavate, yellow to orange, 50–66  $\times$  7–9  $\mu$ m, becoming bifurcate. Basidiospores cylindrical to curved-cylindrical, with an apiculum at the base, thin-walled, yellow, 16–22  $\times$  6–8  $\mu$ m, 3–7 septate.

**Material examined.** BRAZIL, Federal District: Jardim Botânico de Brasília (15°52'12"S, 047°50'59" W), 01.XII.2010. Alvarenga, R.L.M. (25), HUEG 8382;

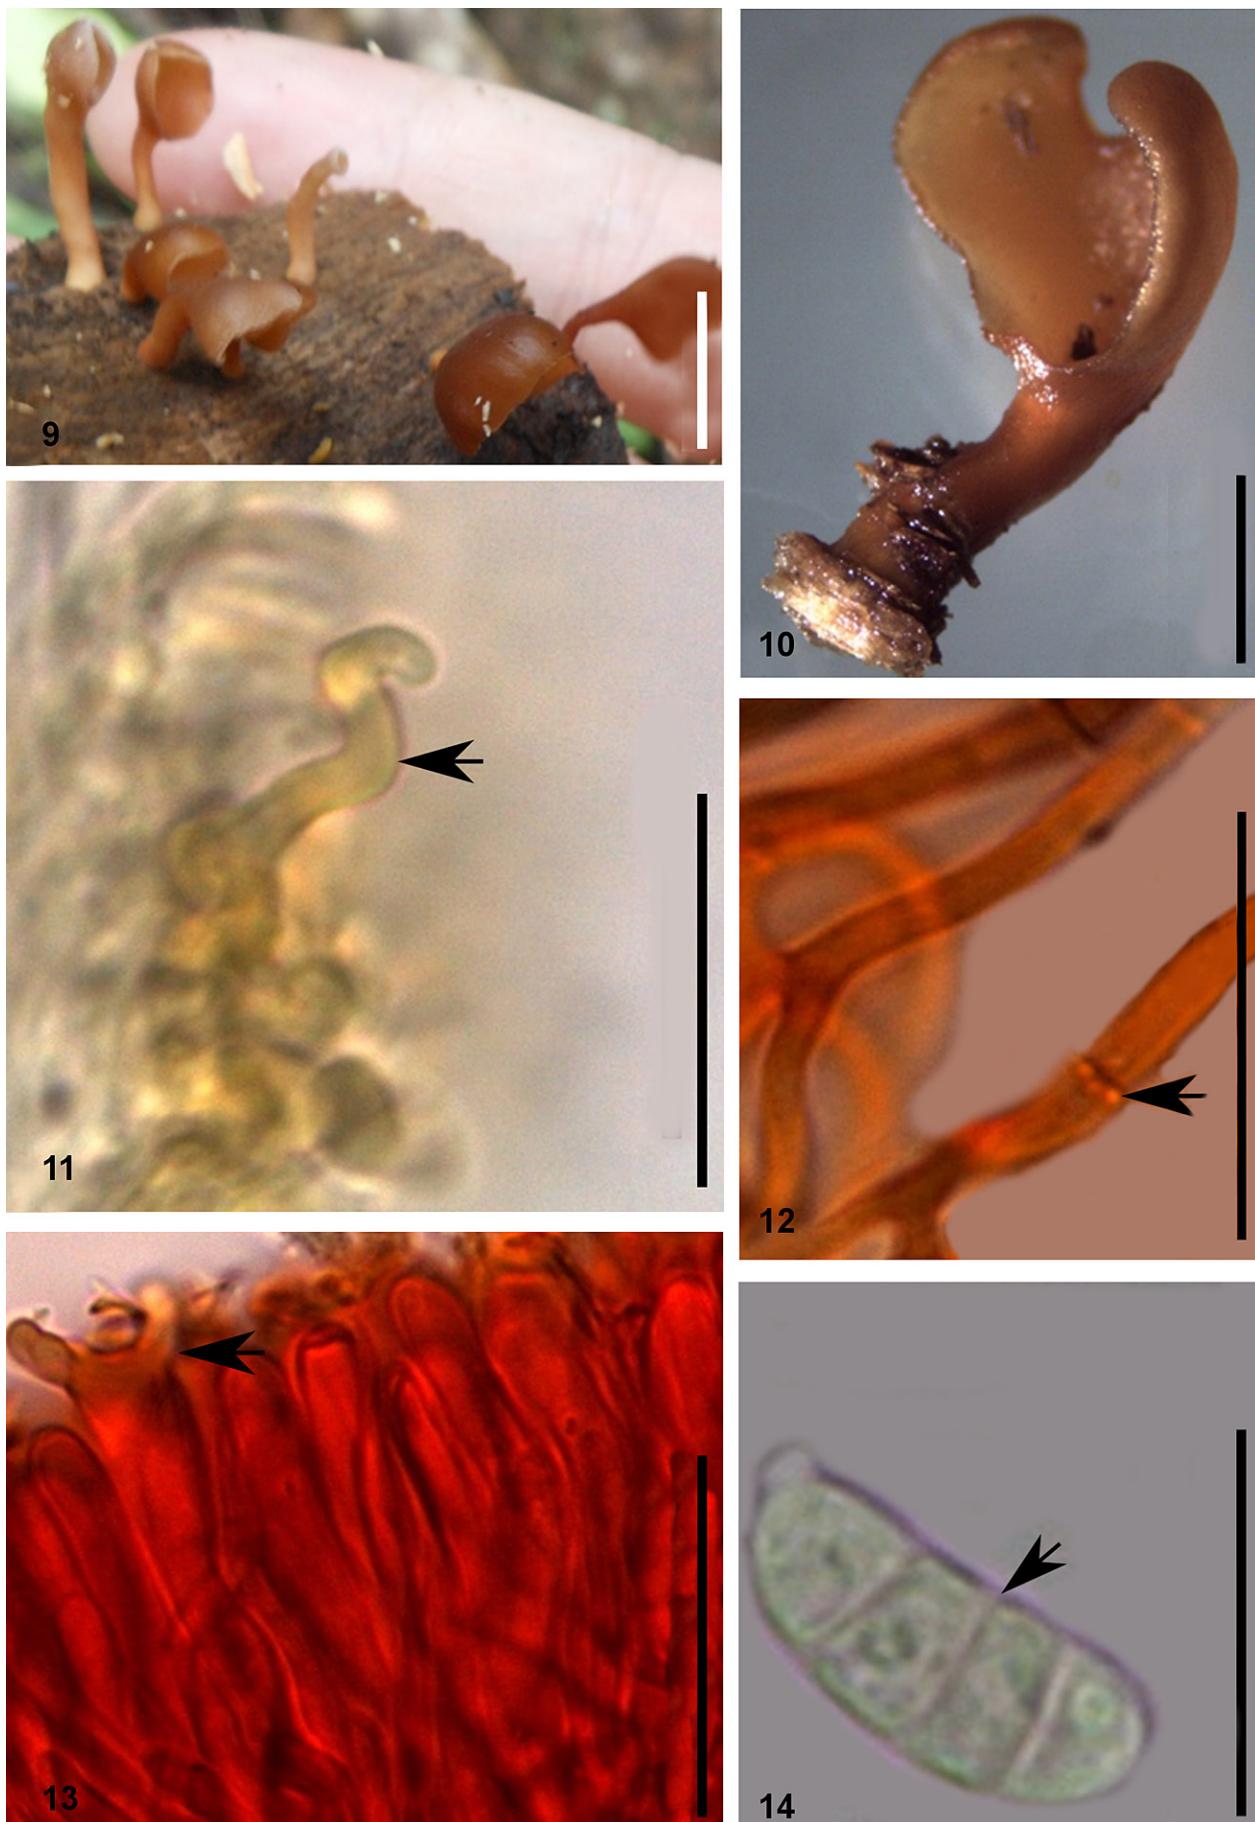

Alvarenga, R.L.M. (27), HUEG 8383; Alvarenga, R.L.M. (28), HUEG 8394; Alvarenga, R.L.M. (33), HUEG 8385.

**Notes on distribution.** Cosmopolitan. In Brazil, this species is known only from Paraná state (Meijer 2006), in the Atlantic Forest biome. It is here newly recorded for Brazil, after 9 years, and this is the first record for the Cerrado biome and for the Midwest Region.

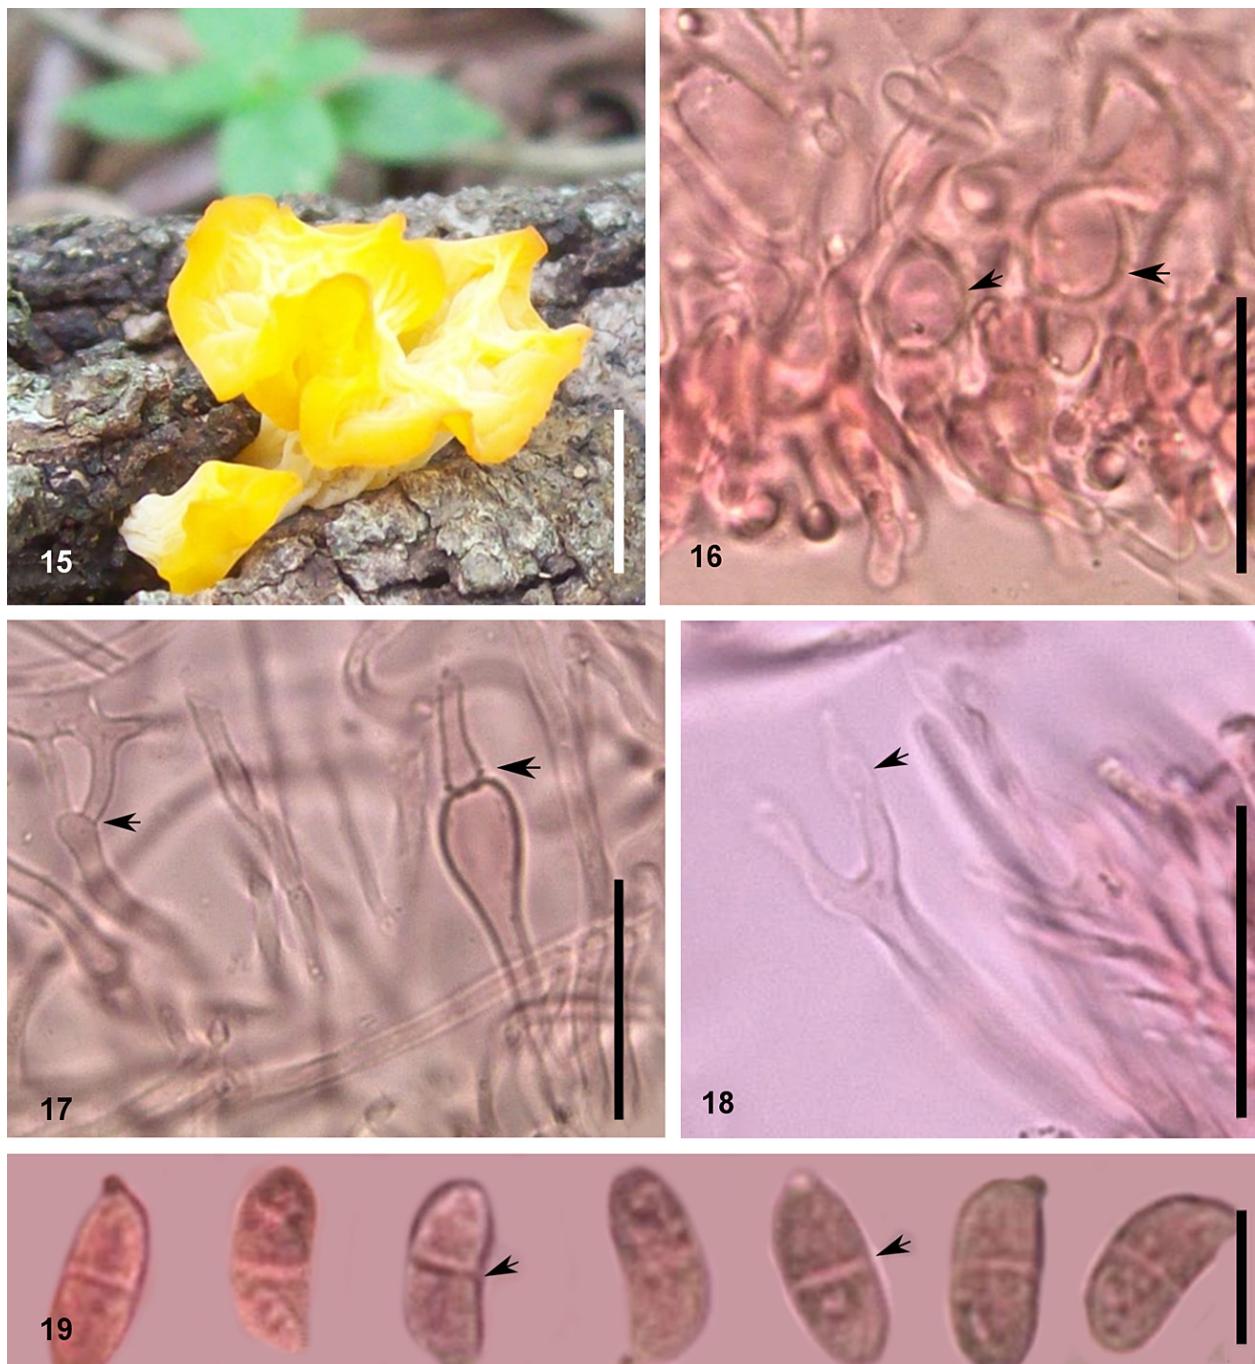

**Additional note.** Due to compaction and dryness of the gelatinous matrix during the drying process of the samples, it was impossible to perform photo-documentation of microscopic characteristics.

**Figures 7, 8.** *Dacrymyces chrysospermus*, basidiomata when fresh. **7.** HUEG 8382. **8.** HUEG 8394. Scale bar = 1 cm.

(4295), HUEG 8461; 10.XII.2010, Xavier-Santos, S. (4508), HUEG 8441; Mata Ciliar do Ribeirão das Antas, AmBev (Filial Cebrasa) (16°17'38" S, 048°48'54" W), 26.X.2010, Xavier-Santos, S. (4564), HUEG 8416; (4553), HUEG 8415.

**Notes on distribution.** Pantropical. In Brazil, this species is recorded in the states of Amazonas, Rio de Janeiro, São Paulo, Paraná and Rio Grande do Sul, where it occurs in the Amazon and Atlantic Forest biomes [Teixeira 1945, Viégas 1945 (as *Guepinia spathularia*), Lowy 1971, Sobestiansky 2005, Meijer 2006]. The new record is the first of this species from the Cerrado biome and from the Midwest Region.

## Discussion

Occurrence data on this group in Brazil is scarce, which possibly derives from the difficulty in maintaining the basidiomata during the drying process and mainly from the scarcity of specialists in the country.

The present study explores a practically unexplored region and adds to the knowledge regarding the geographic distribution of Dacrymycetes in Brazil. This study reports 4 new records of species from the Midwest Region and from the Cerrado biome (*Dacrymyces chrysospermus*, *Dacryopinax elegans*, *D. maxidorii* and *D. spathularia*), and 5 new occurrences for Goiás state (including *Calocera cornea* among those aforementioned). Not since 1971, when *Calocera cornea* was reported from the Federal District, has a jelly fungi (Dacrymycetes) been reported from the Midwest Region of Brazil. Thus, after a 44-year hiatus, the jelly fungi of the Midwest Region are once again discussed in the literature.

## Acknowledgements

We thank Fundação de Amparo à Pesquisa do Estado de Goiás (FAPEG) for the Masters scholarship awarded to the first author and for the financial support (Process no. 201210267001098).

## Authors' Contributions

All the authors have contributed equally in to improving the text, in particular SXS collected most specimens, and RLMA did macro- and microscopical analysis.
