Abstract

The infraorder Gerromorpha (Insecta, Hemiptera, Heteroptera) comprises semiaquatic bugs, most of which live on the water surface, among floating plants or at the margins of water bodies. We made collections of these insects in the Itapecuru and Parnaíba hydrographical basins in eastern Maranhão state, northeastern Brazil, from January to December 2019. Based on the material obtained, we present new records for 23 species, 20 of which are recorded for the first time from Maranhão state.

Keywords

Aquatic insects, lakes, semiaquatic bugs, streams

Citation: Franco CL, Rodrigues JMS, Azevêdo CAS, Moreira FFF (2021) Gerromorpha (Insecta, Hemiptera, Heteroptera) from eastern Maranhão state, northeastern Brazil. Check List 17 (1): 551–568. <https://doi.org/10.15560/17.2.551>

Introduction

Members of the suborder Heteroptera (Insecta, Hemiptera) are distributed worldwide and occupy a wide variety of habitats (Schuh and Slater 1995; Gullan and Cranston 2017). Among the seven infraorders of Heteroptera, Gerromorpha, Leptopodomorpha, and Nepomorpha are associated with water bodies (Nieser and Melo 1997; Panizzi and Grazia 2015). The semiaquatic bugs of the infraorder Gerromorpha are small to mid-sized insects, usually found on the surface or along the margins of bodies of freshwater (Andersen 1982; Dias-Silva et al. 2013). The more than 2,100 known species of Gerromorpha are

currently divided into eight families and approximately 160 genera (Polhemus and Polhemus 2008).

Out of the more than 500 species and 45 genera of Gerromorpha recorded from the Neotropical region (Polhemus and Polhemus 2008), only 11 species have been recorded from Maranhão state, Brazil: *Brachymetra furva* Drake, 1957, *Cylindrostethus palmaris* Drake & Harris, 1934, *Halobates micans* Eschscholtz, 1822 (Gerridae), *Microvelia pulchella* Westwood, 1834, *M. venustatis* Drake & Harris, 1933, *Paravelia cognata* Drake & Harris, 1933, *P. micromaculata* Rodrigues, Moreira,

Nieser, Chen & Melo, 2014, *P. nexa* Drake & Harris, 1933, *P. spinifera* Polhemus & Polhemus, 1984, *Rhagovelia whitei* Breddin, 1898, and *Steinovelia vinnula* Drake, 1951 (Veliidae) (Moreira et al. 2011; Moreira and Campos 2012; Rodrigues et al. 2012, 2014; Rodrigues and Álvarez-Arango 2019; Moreira 2020a, 2020b, 2020c, 2020d, 2020e). We present here new records of Gerromorpha from Maranhão based on material recently collected in the eastern portion of the state.

Study Area

Sampling localities are within two large hydrographical basins, Itapecuru and Parnaíba, in eastern Maranhão state, northeastern Brazil (Fig. 1). The region has a semi-humid equatorial climate, with a mean annual temperature of 28 °C and annual precipitation of 1,100–1,800 mm, which peaks in the rainy season (December–May), while the other half of the year (June–November) encompasses the dry season (Medeiros 2015). The region is dominated by seasonally deciduous forest within areas of Cerrado sensu lato (Lima et al. 2016), with other phytophysiognomies such as rural landscapes, savannas, and seasonal tropical scleromorphic and semideciduous forests (Tannus and Assis 2004; Coutinho 2006; Correia Filho et al. 2011).

Methods

We collected in 25 lotic and lentic environments from January to December 2019 (Figs. 2–4). We collected specimens by active search with the aid of aquatic nets, then fixed and preserved them in 80% ethanol. Material is deposited in the Coleção do Laboratório de Entomologia Aquática, Universidade Estadual do Maranhão, Caxias, Brazil (LEAq). The distribution presented for each

species is according to Moreira (2020a, 2020b, 2020c, 2020d, 2020e) and abbreviations of Brazilian states are according to the official standard (IBGE 2020). First records from Maranhão state are marked by an asterisk (*). We took photographs using a Leica M205 C stereomicroscope coupled with a Leica DMC2900 digital camera. We produced the map with QGIS 3.10.7 (QGIS.org 2020).

Identification. Our specimens were identified based on the following characters: antennomere I shorter than II and III together; eye not surpassing the anterolateral angle of the pronotum; pronotum with apex rounded,

reaching the mesoacetabulum in the apterous form (Fig. 5A); dorsum of acetabula with silvery setae (Fig. 5A, C); fore femur robust and slightly arched, with sparse conical black setae ventrally (Fig. 5B); and male abdominal segment VIII in natural position with about half of its length exposed (Fig. 5B, D). This combination of characters distinguishes them from all known congeners (Cordeiro 2017).

Distribution in Brazil. AM, PA, MA*, CE, BA, MT, MG, SP, RJ.

Jun. 2019; C.L. Franco et al. leg.; LEAq 00006.

Identification. Our specimens of *B. lata* can be distinguished from *B. albinervus* and other species of the genus based on the eye surpassing the anterolateral angle of the pronotum (Fig. 5E); the quadrate posterior margin of the pronotum (Fig. 5E); the lack of silvery setae on the dorsum of the acetabula (Fig. 5E, G); and the fore femur slender, densely covered by conical black setae on the venter (Cordeiro 2017).

Franco et al. leg.; LEAq 00126, 00138, 00148 • 21 ♂, 23 ♀; Maranhão, Codó, Saco river; -04.62482, -043.90249; 02 Oct. 2019; C.L. Franco et al. leg.; LEAq 00276.

Identification. Our material was identified based on the apterous males, which have the pronotum long, completely covering the mesonotum (Fig. 11A); the hind trochanter with a few small spines and a larger apical spine; the hind tibia with small subequal spines throughout its length and a straight apical spur; and the sides of abdominal segment VII with patches of small black denticles (Magalhães et al. 2016). Females were associated with

males from the same locality based on the general appearance and by comparison with the original description of the species.

Distribution in Brazil. PA, MA*.

Rhagovelia hambletoni Drake & Harris, 1933

Figure 11E–H

New records. BRAZIL • 5 ♂, 5 ♀; Maranhão, Caxias, Baixa Grande stream; -04.75722, -043.66055, 06 Aug. 2019; C.L. Franco et al. leg.; LEAq 00004 • 1 ♂; Maranhão, Caxias, Batatal stream; -04.96166, -043.38916; 07 Aug. 2019; C.L. Franco et al. leg.; LEAq 00008 • 18 ♂, 9 ♀; Maranhão, Codó, Buriti Corrente stream; -04.75194, -043.66638; 04 Oct. 2019; C.L. Franco et al. leg.; LEAq 00184 • 63 ♂, 44 ♀; Maranhão, Aldeias Altas, Poção stream; -04.67388, -043.54138; 27 Aug. 2019; C.L. Franco et al. leg.; LEAq 00107, 00113, 00119, 00221 00223, 00226, 00227, 00229, 00230.

Identification. Both males and females of *R. hambletoni* could be reliably identified. The pronotum is short, not covering the mesonotum (Fig. 11E, G), like in other species of the *angustipes* complex (Polhemus 1997). Males lack a spine on the fore trochanter, have black middle coxa (Fig. 11F), bear about seven spines on the hind femur, display shiny black areas dorsally on the center of abdominal segments V–VIII (Fig. 11E), and have laterotergites gradually tapering posteriorly (Fig. 11E). Females have hind trochanter yellowish (Fig. 11H), hind femur with three to five spines, and abdominal laterotergites reflected over the mediotergites (Fig. 11G) (Moreira 2012).

Distribution in Brazil. MA*, BA, MT, MS, MG, ES, SP, RJ.

Rhagovelia robusta Gould, 1931

Figure 11I–L

New records. BRAZIL • 24 ♂, 128 ♀; Maranhão, Caxias, Correntinho stream; -04.82666, -043.37694; 26 Aug. 2019; C.L. Franco et al. leg.; LEAq 00177, 00178 • 25 ♂, 31 ♀; Maranhão, Codó, Saco river; -04.62482, -043.90249; 02 Oct. 2019; C.L. Franco et al. leg.; LEAq 00276.

Identification. Our males of *R. robusta* were identified based on the pronotum long, completely covering the mesonotum, mostly blackish, strongly contrasting with a yellowish-brown mark on the anterior lobe (Fig. 11I); jugum and proepisternum with minute black denticles; the hind trochanter with spines; the hind femur with three irregular rows of spines, with a large spine near its middle dorsally displaced from the others; and the sides of abdominal segment VII without patches of black denticles (Magalhães et al. 2016). Females were associated with males from the same locality based on the general appearance and by comparison with reference material from other Brazilian states.

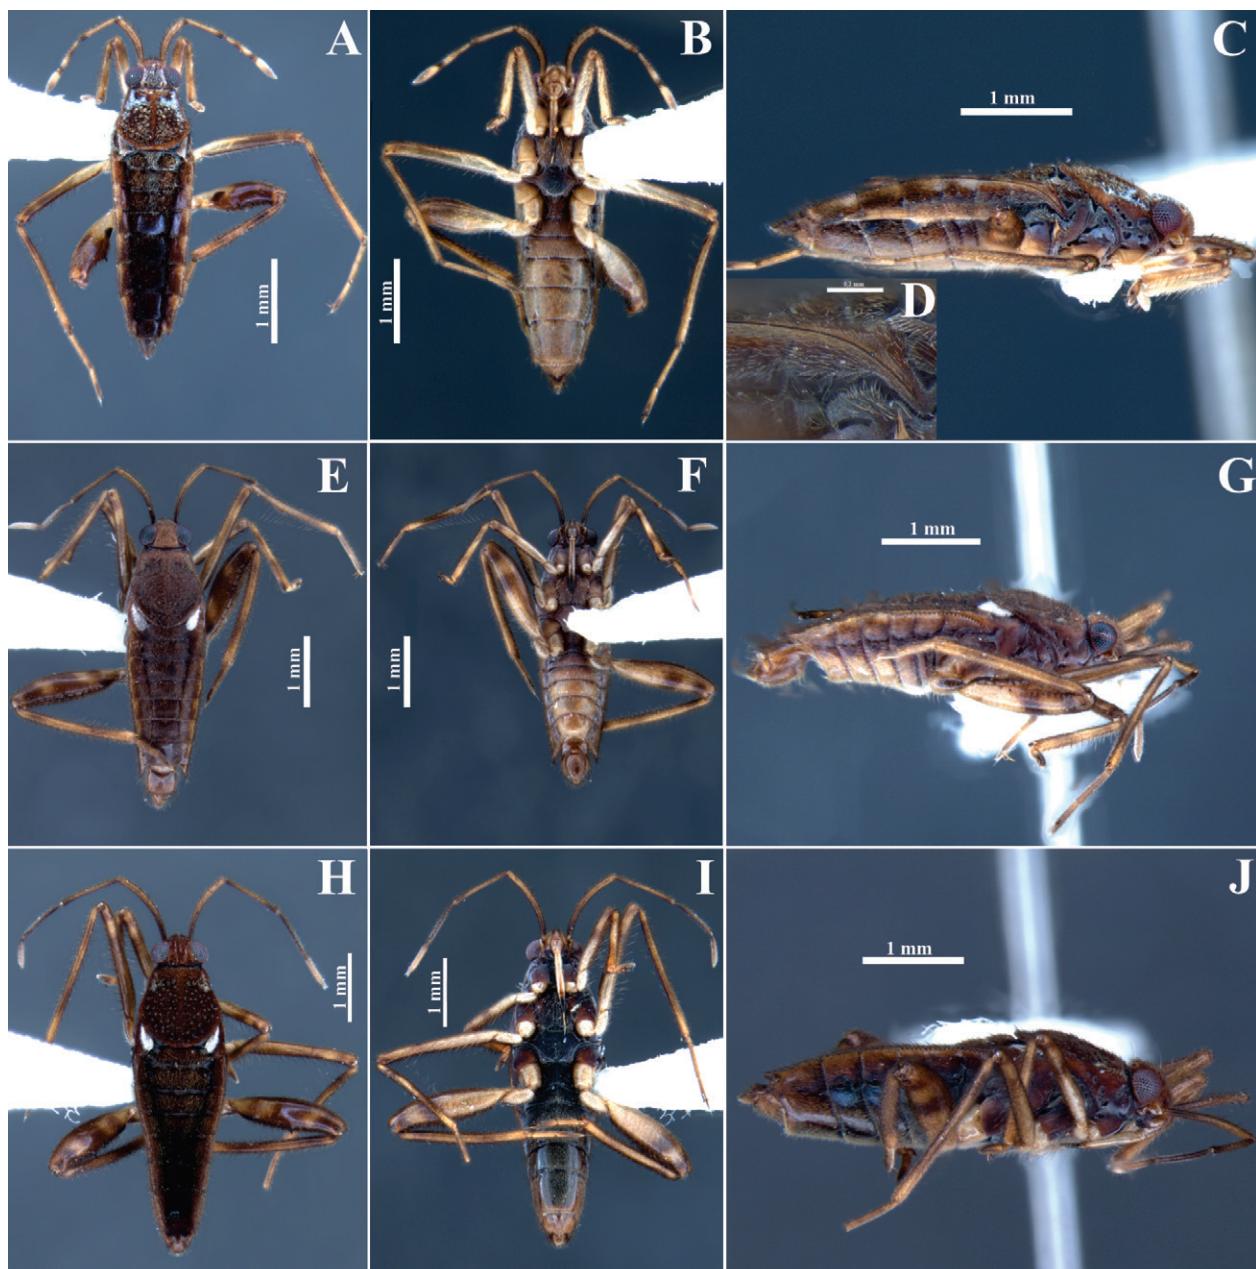

Figure 12. Gerromorpha from eastern Maranhão state, northeastern Brazil. **A–D.** *Stridulivelia astralis*, apterous female. **A.** Dorsal view. **B.** Ventral view. **C.** Lateral view. **D.** Detail of stridulatory structure on abdominal laterotergite. **E–G.** *Stridulivelia ayacucho*. **E–G.** Micropterous male. **E.** Dorsal view. **F.** Ventral view. **G.** Lateral view. **H–J.** Micropterous female. **H.** Dorsal view. **I.** Ventral view. **J.** Lateral view.

Rhagovelia tenuipes Champion, 1898

Figure 11M–O

New records. BRAZIL • 2 ♀; Maranhão, Caxias, Baixa Grande stream; -04.75722, -043.66055, 06 Aug. 2019; C.L. Franco et al. leg.; LEAq 00267 • 36 ♂, 19 ♀; Maranhão, Caxias, Primavera stream; -04.84916, -043.49527; 06 Aug. 2019; C.L. Franco et al. leg.; LEAq 00176 • 150 ♂, 112 ♀; Maranhão, Codó, Saco river; -04.62482, -043.90249; 02 Oct. 2019; C.L. Franco et al. leg.; LEAq 00275.

Identification. Like *R. hambletoni*, *R. tenuipes* belongs to the *angustipes* complex of species (Polhemus 1997). Our males could be distinguished from *R. hambletoni*

by the abdominal laterotergites bowed laterally and the longer hind femur, slightly longer than half of the body length (Fig. 11M). Females of *R. tenuipes* were easily distinguished from those of *R. hambletoni* based on the laterotergites not reflected over the mediotergites (Fig. 11O) and the hind femur with at least seven spines (Moreira 2012).

Distribution in Brazil. RR, AM, PA, MA*, MT, MS, MG, ES, SP, RJ.

Subfamily Veliinae

Stridulivelia Hungerford, 1929

Stridulivelia astralis (Drake & Harris, 1938)

Figure 12A–D

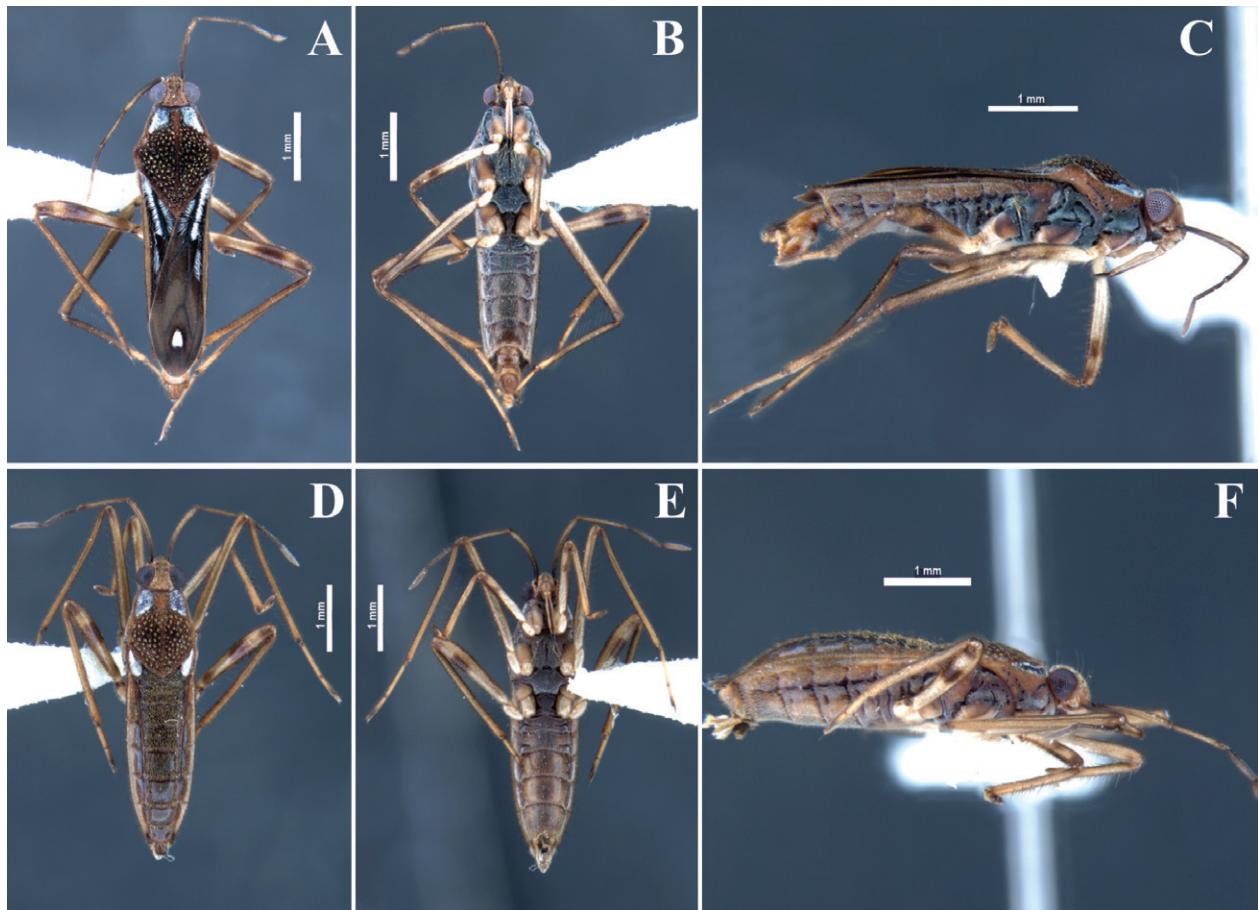

Figure 13. Gerromorpha from eastern Maranhão state, northeastern Brazil. **A–F.** *Stridulivelia tresa*. **A–C.** Macropterous male **A.** Dorsal view. **B.** Ventral view. **C.** Lateral view. **D–F.** Micropterous female. **D.** Dorsal view. **E.** Ventral view. **F.** Lateral view.

gem stream; -04.87562 , -043.09894 ; 10 Dec. 2019; C.L. Franco et al. leg.; LEAq 00283.

Identification. Our material of this genus was identified based on the key provided by Floriano et al. (2017). The females above lack spines on the humeral angles (Fig. 12A); have the stridulatory structure on the lateral margin of the abdominal laterotergites formed by a row of tightly packed minute pegs (Fig. 12D); the first three visible abdominal segments with transverse lateral sulci; the hind femur incrassate, about two times wider than the middle femur, with a spine on the distal two-thirds of the posterior margin distinctly larger than others (Fig. 12A); and the dorsum of abdominal segment VIII without projections.

Distribution in Brazil. TO, MA*, MT, MS, MG.

Stridulivelia ayacucho Polhemus & Spangler, 1995

Figure 12E–J

New records. BRAZIL • 3 ♂; Maranhão, Codó, Baixa Grande II stream; -04.73222 , -043.70638 , 05 Oct. 2019; C.L. Franco et al. leg.; LEAq 00197 • 1 ♀; Maranhão, Caxias, Barragem stream; -04.87562 , -043.09894 ; 10 Dec. 2019; C.L. Franco et al. leg.; LEAq 00284 • 1 ♀; Maranhão, Caxias, Jatobá stream; -04.90972 , -043.11666 ; 28 Aug. 2019; C.L. Franco et al. leg.; LEAq 00135.

Identification. The specimens above differ from *S.*

astralis by the stridulatory structure on the lateral margin of the laterotergites formed by a row of widely separated knob-like denticles (Fig. 12G, J). The male has the venter of abdominal segment VIII centrally expanded but not forming a lobule, and the female has short posterior projections on the dorsum of abdominal segment VIII, with about one-third the length of the segment at the midline (Floriano et al. 2017).

Distribution in Brazil. PA, MA*, MT, MG, SP.

Stridulivelia tresa (Drake & Harris, 1941)

Figure 13A–F

New records. BRAZIL • 1 ♂; Maranhão, Caxias, Areia Branca stream; -05.03720 , -043.48580 ; 13 Aug. 2019; C.L. Franco et al. leg.; LEAq 00242 • 2 ♂; Maranhão, Codó, Baixa Grande II stream; -04.73222 , -043.70638 , 05 Oct. 2019; C.L. Franco et al. leg.; LEAq 00198 • 1 ♂, 2 ♀; Maranhão, Caxias, Barragem stream; -04.87562 , -043.09894 ; 10 Dec. 2019; C.L. Franco et al. leg.; LEAq 00239 • 1 ♂, 1 ♀; Maranhão, Caxias, Jatobá stream; -04.90972 , -043.11666 ; 28 Aug. 2019; C.L. Franco et al. leg.; LEAq 00125.

Identification. Like *S. ayacucho*, our specimens of *S. tresa* have the stridulatory structure on the lateral margin of the abdominal laterotergites formed by a row of widely separated knob-like denticles (Fig. 13C, F).

However, they have the first four or five visible abdominal segments with transverse lateral sulci (two in *S. ayacucho*), and the female lacks projections on abdominal tergite VIII (present in *S. ayacucho*) (Floriano et al. 2017).

Distribution in Brazil. AM, PA, MA*, MT, MG, ES.

Discussion

We collected 1,778 specimens in the study area, representing 23 species of the five families of Gerromorpha recorded from Brazil (Moreira 2020a, 2020b, 2020c, 2020d, 2020e). Among the 11 species of the infraorder previously recorded from Maranhão state, we did not examine material of *Halobates micans*, *Brachymetra furva*, *Rhagovelia whitei*, *Paravelia cognata*, *P. micro-maculata*, *P. nixa*, *P. spinifera*, and *Steinovelia vinnula*. *Halobates micans* is one of the five species of insects that live on the open ocean (Andersen and Cheng 2004), whereas *B. furva* has questionable validity and is being revised (Cordeiro 2017). The absence of *R. whitei* in the samples is unexpected, because it is a common species in the Cerrado biome (Dias-Silva et al. 2013; Giehl et al. 2020). The other species above are rare and known from material obtained on at most three localities each, except for *P. spinifera*, which seems to be more common than the rest between western Maranhão state and Suriname (Rodrigues et al. 2014).

The present study adds 20 species to the fauna of Gerromorpha from Maranhão, increasing the known diversity of the area to 31 species. Further collections on central and western Maranhão will surely provide additional first records from the state and from northeastern Brazil because the aquatic insects of the Amazonian portion of the state are still poorly known (Costa et al. 2016).

Acknowledgements

CLF received a master's scholarship from the Fundação de Amparo à Pesquisa e ao Desenvolvimento Científico e Tecnológico do Maranhão (#BM-04042/19) and thanks the Programa de Pós-graduação em Biodiversidade, Ambiente e Saúde, Centro de Estudos Superiores de Caxias, Universidade Estadual do Maranhão, for logistical support. JMSR benefited from a postdoctoral fellowship (#202.317/2018) provided by the Fundação Carlos Chagas Filho de Amparo à Pesquisa do Estado do Rio de Janeiro (FAPERJ). FFFM benefited from grants provided by the Conselho Nacional de Desenvolvimento Científico e Tecnológico (#301942/2019-6) and FAPERJ (#E-26/203.207/2017).

Authors' Contributions

CLF collected and identified specimens, produced the map, and wrote the manuscript. JMSR identified and photographed specimens. FFFM revised identifications. JMSR, CASA, and FFFM revised the manuscript.
