**Abstract:** We confirm the occurrence of the rare bat *Cyttarops alecto* in piedmont and alluvial plain savannas of the Orinoco Llanos. Our records are the first for the species in Colombia in 22 years. The species was known only from Neotropical rainforests and one locality in the Cerrado formation in Brazil. Our records are supported with voucher specimens that match the diagnosis and variability described for the species. With these records, we reduce the geographical distribution gap between known Trans-Andean and Cis-Andean localities of this species in the northern Neotropics.

**Key words:** Diclidurini; Casanare; Neotropical flooded savannas; gallery forest; geographic distribution; range extension

The Short-eared Bat, *Cyttarops alecto* Thomas, 1913, is considered one of the rarest Neotropical bats, known only by 27 specimens from 19 localities (Lim et al. 2008; Rivas Rodriguez and Ferrer Pérez 2012; Tavares et al. 2012). Despite the scarcity of documented records, this species is widely distributed in lowland forests below 500 m above sea level (a.s.l) from Nicaragua to Brazil and Bolivia (Ochoa et al. 1994; Hood and Gardner 2008; Lim et al. 2008; Aguirre et al. 2010). Currently, the known geographic distribution of *C. alecto* has a wide gap between Central and South America: the nearest localities in Central America are in Barro Colorado, Panama, while the records in South America belong to the Guiana region near the Caura River (Venezuela) and Amazonian region in Leticia (Colombia). The distance between these localities is between 1,600 km to 1,800 km. This may suggests that the distribution of this species in northern South America is poorly known.

In Colombia, *C. alecto* was known from only one specimen that was captured in 1972 in Leticia, department of Amazonas (Ochoa et al. 1994; Solari et al. 2013). Later, Cuervo et al. (1986) reported the species from the lowlands of Colombia, and Alberico et al. (2000) reported it from the department of Vichada. The latter record is based on material deposited at Instituto de Investigación de Recursos Biológicos Alexander von Humboldt, Villa de Leyva (IAvH). However, neither Cuervo et al. (1986) nor Alberico et al. (2000) provided catalogue numbers of vouchers or specific localities to confirm this species’ distribution. The hypothesis is that the distribution of *C. alecto* in Colombia comprises the Amazonian region south of the Putumayo River, and that the presence of the species in the Caribbean and Orinoco regions is still uncertain (Mantilla-Meluk et al. 2014).

Herein, we present the first confirmed records of *C. alecto* from the Orinoco Llanos of Colombia. Our records come from two different natural regions following Sarmiento (1983): the piedmont savannas and the alluvial plains. We also looked for specimens in the mammal collection of IAvH that would support the previous report of this species by Alberico et al. (2000). We comment the morphological variation of the species based on our material and that previously described in the literature. Additionally, we provide insights on the habitats of the species.

We consulted specimens housed in the mammalian collection “Alberto Cadena Garcia” of Instituto de Ciencias Naturales of the Universidad Nacional de Colombia (ICN), and the collection of mammals of IAvH. External measurements were transcribed from specimen tags. Forearm and skull measurements were taken following Simmons and Voss (1998) with digital calipers to the nearest 0.01 mm.
Calderón-Capote et al. | First confirmed records of *Cyttarops alecto* in Colombian Llanos

We found only one specimen identified as *C. alecto* (IAvH 1323, from Vichada department, Colombia) in the collection of mammals of the IAvH; however, this specimen corresponds to *Myotis nigricans* Schinz, 1821. Therefore, we consider uncertain the distribution of *C. alecto* in Vichada department.

Calderón-Capote et al. | First confirmed records of Cyttarops alecto in Colombian Llanos

Cyttarops alecto is an aerial insectivore emballonourid, characterized by its moderate size (forearm 40–47 mm), smoky gray pelage, and the lack of wing sacs or glands in the uropatagium. The skull exhibits a deep cuplike depression in the rostrum and the postorbital processes are long and not fused to the supraorbital ridge (Hood and Gardner 2008). All specimens have the external and cranial diagnosed characters mentioned above (Figures 2 and 3; Jones and Hood 1993; Hood and Gardner 2008). However, our specimens show variation in some recently reported characters, such as a diastema between the upper premolars, a naked patch of skin over the front head, and a posterior ventral process of the mandible (Velazco et al. 2011; Tavares et al. 2012). In our material, the diastema between the upper premolars remains, but do not have a naked patch of skin over the front head. The posterior ventral process of the mandible presents intraspecific variation from completely absent to highly developed, including specimens from the same locality and the same sex (ICN 21912 and IAvH-Temp-ABJ690 [RCFR 392]).

Measurements of our records concur with earlier reports from Brazil (Thomas 1913; Nunes et al. 2006; Tavares et al. 2012), Peru (Velazco et al. 2011), French Guiana (Masson and Cosson 1992), Nicaragua (Baker and Jones 1975), Costa Rica (Starrett and de la Torre 1964; Starrett and Casebeer 1968; Reid and Langtimm 1993), and Colombia (Ochoa et al. 1994) and show no evidence of notable variation throughout the species range (Table 2). Therefore, the external and cranio-dental measurements suggest that despite the lack of material available the morphological dissimilarities (see above) do not necessarily represent geographic variations or different taxonomic entities as suggested by Velazco et al. (2011).

Our records are the first known from savanna ecosystems in northern South America. All previous localities for the species were in Amazonian and Guiana rainforests, Trans-Andean rainforests of Central America, and the Brazilian Cerrado (Thomas 1913; Starrett and de la Torre 1964; Starrett and Casebeer 1968; Starrett and Casebeer 1968; Starrett and de la Torre 1964; Starrett and Casebeer 1968; Starrett and Casebeer 1968; Starrett and Casebeer 1968; Starrett and Casebeer 1968; Starrett and Casebeer 1968).

Calderón-Capote et al.  |  First confirmed records of Cyttarops alecto in Colombian Llanos

Baker and Jones 1975; Masson and Cosson 1992; Reid and Langtimm 1993; Ochoa et al. 1994; Nunes et al. 2006; Velazco et al. 2011; Rivas Rodríguez and Ferrer Pérez 2012; Tavares et al. 2012). Although the floristic composition is different between Brazilian Cerrado and Orinoco Llanos of Colombia, landscape similarities are evident showing savanna influence (Sarmiento 1983). The occurrence of the species in other natural regions of South America, such as the Orinoco Llanos, means that these can provide additional roosts and suitable habitats for the species to inhabit, suggesting the ability of C. alecto to adapt to different environments (Starrett 1972; Velazco et al. 2011; Tavares et al. 2012).

The current distribution of this species in the Orinoco Llanos suggests that it may occur elsewhere in the region including the portion of the Llanos and Amazon in Venezuela. The new records documented here for the northern Neotropics reduce the distribution gap between the Cis-Andean and Trans-Andean regions and suggests the presence of the species in other lowlands of Colombia.

Although it has been suggested that ground mist nets are not appropriate to survey this type of bats (Velazco et al. 2011), all the specimens from Casanare were captured using this technique at ground level in clearings and along roads inside forests that are characterized by an abundance of palms as reported by Ochoa et al. (1994). However, the scarcity of material of C. alecto implies that bat sampling methods must include different approaches, such as canopy and subcanopy mist nests in addition to echolocation call recordings, as a way of maximizing the data collection.

Figure 3. Dorsal (upper), ventral (middle) and lateral (lower) views of the skull and lateral view of the mandible of Cyttarops alecto (ICN 21656). Middle arrows: diastema between the upper premolars; bottom arrow: posterior ventral process of the mandible.

Table 2. Range of external and skull measurements (mm) and body mass (g) of Cyttarops alecto based on all previous records summarize by Tavares et al. (2012) and mean and range of male specimens report here. Abbreviations: Total body length (TL), Tail length (TV), Hind foot length (HF), Ear length (EAR), Forearm length (FA), Greatest length of the skull (GLS), Condylar breadth (CBL), Prootic breadth (ZB), Mastoid breadth (BM), Braincase breadth (BBC), Maxillary toothrow length (CM3), Breadth across molars (M3M3). Specimen: fluid preserved with skull removed1, Skin, skull and body specimen 2.

ACKNOWLEDGEMENTS
We give special thanks to Hugo López Arevalo (ICN), Catalina Cárdenas González (ICN), and Claudia Medina (IAvH) for permitting us to study specimens under their care. We also sincerely thank our field assistants and the farm proprietors. Laboratorio de Equipos Ópticos Compartidos (LEOC) from the Departamento de Biología de Facultad de Ciencias, Universidad Nacional de Colombia provided photographic assistance of Figure 3. The specimens collected from the municipality of Hato Corozal, Casanare, were obtained during the project: “Conservación de especies amenazadas en el área de influencia del Oleoducto Bicentenario, Convenio de cooperación No. 15-14-172-010CE between Parex Resources Ltda., and the Fundación Reserva Natural La Palmita, Centro de Investigación”. The specimens collected from municipality of Trinidad, Casanare, were obtained during the project “Programa de diagnóstico y monitoreo de la diversidad biológica de las sabanas inundables para la evaluación de su integridad ecológica. Primera etapa: Mamíferos y aves, orden de servicio OS 411000797 between Paredex Resources Ltda., and the Fundación Reserva Natural La Palmita, Centro de Investigación.” Héctor Ramírez Chaves and Camilo A. Calderón-Acevedo reviewed an early version of the manuscript. Two anonymous reviewers provided comments to the final version.
