**Abstract**

The first occurrence of *Phallotorynus victoriae* is reported from the Uruguay river basin associated with the grasslands of the Pampa Biome, southern Brazil. The record includes only one specimen from a tributary to Ibicuí River located in the municipality of Uruguaiana, Rio Grande do Sul state.

**Key words**

Biodiversity; Ibicuí basin; gonopodium; Pampa Biome; taxonomy.

**Introduction**

Poeciliinae is broadly distributed throughout the Americas (Lucinda 2003) and comprises about 274 described species, 34 of those described in the last 10 years (Eschemeyer and Fong 2017). The genus *Phallotorynus* Henn, 1916 contains small poeciliids endemic to South America and known from Paraíba do Sul, Paraná, and Paraguay rivers (Lucinda et al. 2005). Currently, the genus comprises 6 valid species: *Phallotorynus dispilos* Lucinda, Rosa & Reis, 2005, *P. fasciolatus* Henn, 1916, *P. jucundus* Ichering, 1930, *P. pankalos* Lucinda, Rosa & Reis, 2005, *P. psittakos* Lucinda, Rosa & Reis, 2005, and *P. victoriae* Oliveros, 1983 (Eschemeyer and Fong 2017). *Phallotorynus victoriae* was recorded from the lower portions of Paraná river basin in Argentina, Brazil and Paraguay (Oliveros 1983, Lucinda and Reis 2005, Lucinda et al. 2005, Meyer and Etzel 2006, Eschemeyer et al. 2017). For the state of Rio Grande do Sul, 422 species are recorded (Bertaco et al. 2016) and with 9 of those belonging to the Poeciliidae: *Cnesterodon brevirostratus* Rosa & Costa, 1993; *C. decemmaculatus* (Jenyns, 1842); *Cnesterodon* sp. n. A; *Cnesterodon* sp. n. B; *Phalloceros caudimaculatus* (Hensel, 1868); *P. heptaktinos* Lucinda, 2008; *P. spiloura* Lucinda, 2008; *Phalloptychus iheringii* (Boulenger, 1889); and the introduced *Poecilia vivipara* Bloch & Schneider, 1801. The genus *Phallotorynus* has not been recorded from the Rio Grande do Sul state to date and neither from the Uruguay river basin. Thus, the first record of *Phallotorynus victoriae* from Rio Grande do...
Sul state, southern Brazil and from the Uruguay river basin is reported here, which suggests a broader distribution for this species.

Methods

The specimen of *Phallotorynus victoriae* (Fig. 1) was collected in Ipané stream, a tributary of Ibicuí, 10 km from road BR 472 under the São João Arregui bridge (29°29′53″ S, 056°35′43″ W, 61 m above sea level, Fig. 2), located in the municipality of Uruguaiana, Rio Grande do Sul, Brazil. The specimen was fixed in 10% formalin, later transferred to 70% alcohol, and deposited at the collection of fishes of Laboratory of Ichthyology of Universidade Federal do Rio Grande do Sul (UFRGS) under the following voucher number: UFRGS 23645, 1 specimen, male, 15.3 mm standard length (SL). Measurements follow Lucinda et al. (2005) and were made with a digital caliper reading to the nearest 0.1 mm. Distribution map was made with the software Quantum GIS v. 1.8.0 (Scherman et al. 2005).

Results

**New record.** Brazil, Rio Grande do Sul, Uruguay basin, Ibicuí River (29°29′53″ S, 056°35′43″ W), Junior Chuc-

Phallotorynus victoriae in Uruguay basin, Rio Grande do Sul, Brazil

Chuctaya et al., Laura M. Donin, Tiago P. Carvalho, Carolina S. Vieira, Luiz R. Malabarba, 9 July 2017, UFRGS 23645, 1 individual.

Identification. Lucinda et al. (2005) diagnosed Phallotorynus as having the following features in the gonopodium: V-shaped ventral projection on distal portion (vvp) of ray 3; trowel-like appendix at tip (tat) of ray 3; large membrane on pedicel (imp) of gonopodium; membranous tip anterior (mta) to rays 4 and 5. All these features were observed in the gonopodium of the P. victoriae specimen (Fig. 3). Phallotorynus victoriae is distinguished from P. fasciolatus, P. dispilos, P. jucundus, and P. pankalos by color pattern (1 vs 2–9 spots on the lateral portion of body). Phallotorynus victoriae is distinguished from P. psittakos by the number of gonopodial rays (8 vs 9). The morphometric characters are shown in Table 1.

Discussion

In poecilids, the gonopodium plays a very important role in the copulation process and used as a diagnostic feature within the family (Chambers 1987, Chambers 1990, Lucinda et al. 2005, Lucinda and Graça 2015). According to Chambers (1987), the length of the gonopodium relative to the standard length varies markedly amongst the genera of Poeciliidae, forming 2 main groups: the first group formed by species with longer gonopodia (50–70% of SL). The gonopodium base is inserted just posterior to a vertical from the pectoral fin base (e.g. Poeciliopsis, Phallichthys, Cnesterodon and Heterandria). The second group are species with short gonopodia (33% or less of SL). The gonopodium base is anteriorly situated, almost between the pelvic fins at or about a vertical drawn from the dorsal fin origin (e.g. Alfaro, Poecilia, Priapella, Belonesox and Xiphophorus). Phallotorynus may be categorized in the second group, with length of the gonopodium of 36% of SL, which is lower than that recorded for the first group.

Morphometric analysis of the specimen (Table 1) shows a lower body depth than that recorded by Lucinda et al. (2005), showing that this species has a greater range of variation in this measurement, as recorded for Phallotorynus fasciolatus (23.6–32.1% of SL).

All Phallotorynus species have not yet been assessed for the IUCN Red List, but in Brazil, P. fasciolatus and P. jucundus are considered Endangered (ICMBio 2016). Phallotorynus victoriae is known from several places (Lucinda et al. 2005) and has an Extent of Occurrence exceeding 20,000 km². Although this species seems rare and is known only in habitats with intact riparian vegetation, based on its wide distribution along the Paraná and

Uruguay rivers, this species can be classified as Least Concern using IUCN criteria (IUCN 2017).

Finally, this record suggests that although the Uruguay river basin is relatively well known, there are still unexplored habitats, where there may be species not yet reported, such as the recently reported Ctenobrycon cf. alleni (Eigenmann & McAtee, 1907), Serrapinnus kriegi (Schindler, 1937), and Laetacara dorsigera (Heckel, 1840), which were known from Paraguay and Paraná river basins (Bertaco et al. 2016). Therefore, this study is the first record of the genus Phallotorynus and extends the distribution of P. victoriae in the Uruguay river basin and the state of Rio Grande do Sul.

Acknowledgements

We thank Luiz R. Malabarba (UFRGS) and Juliana Wingert (UFRGS) for their contributions by editing images and procedure, respectively. Thanks for financial support are due to Conselho Nacional de Desenvolvimento Científico e Tecnológico (CNPq), Coordenação de Aperfeiçoamento de Pessoal de Nível Superior (CAPES), and Programa Nacional de Pós Doutorado da Coordenação de Aperfeiçoamento de Pessoal de Nível Superior (PNPD-Capes) to Tiago P. Carvalho

Authors’ Contributions

JC, LMD, CSV and TPC collected the specimens; TPC, LMD and JC examined and identified the specimen; DFF, LMD and JC prepared the figures. All authors prepared, reviewed, finalized, and approved the manuscript.
